# Chapter 1

## Functions

### 1.1 prime – primality test , prime generation

#### 1.1.1 trialDivision – trial division test

**trialDivision(n: *integer*, bound: *integer/float=0*) → *True/False***

Trial division primality test for an odd natural number.

**bound** is a search bound of primes. If it returns 1 under the condition that **bound** is given and less than the square root of **n**, it only means there is no prime factor less than **bound**.

#### 1.1.2 spsp – strong pseudo-prime test

**spsp(n: *integer*, base: *integer*, s: *integer=*None, t: *integer=*None) → *True/False***

Strong Pseudo-Prime test on base **base**.

**s** and **t** are the numbers such that  $n - 1 = 2^s t$  and **t** is odd.

### 1.2 smallSpsp – strong pseudo-prime test for small number

**smallSpsp(n: *integer*) → *True/False***

Strong Pseudo-Prime test for integer **n** less than  $10^{12}$ .

4 spsp tests are sufficient to determine whether an integer less than  $10^{12}$  is prime or not.

### 1.2.1 `miller` – Miller’s primality test

`miller(n: integer) → True/False`

Miller’s primality test.

This test is valid under GRH. See `config`.

### 1.2.2 `millerRabin` – Miller-Rabin primality test

`miller(n: integer, times: integer=20) → True/False`

Miller’s primality test.

The difference from `miller` is that the method uses (fast) probabilistic algorithm, on the other hand, `miller` employs deterministic algorithm under GRH.

`times` (default to 20) is the number of repetition. The error probability is at most  $4^{-\text{times}}$ .

## 1.3 `lpsp` – Lucas test

`lpsp(n: integer, a: integer, b: integer) → True/False`

Lucas test.

Return True if `n` is a Lucas pseudoprime of parameters `a`, `b`, i.e. with respect to  $x^2 - ax + b$ .

## 1.4 `fpsp` – Frobenius test

`fpsp(n: integer, a: integer, b: integer) → True/False`

Frobenius test.

Return True if `n` is a Frobenius pseudoprime of parameters `a`, `b`, i.e. with respect to  $x^2 - ax + b$ .

## 1.5 apr – Jacobi sum test

**apr**(*n*: *integer*) → *True/False*

APR (Adleman-Pomerance-Rumery) primality test or the Jacobi sum test.

Assuming *n* has no prime factors less than 32. Assuming *n* is spsp (strong pseudo-prime) for several bases.

## 1.6 primeq – primality test automatically

**primeq**(*n*: *integer*) → *True/False*

A convenient function for primality test.

It uses one of **trialDivision**, **smallSpsp** or **apr** depending on the size of *n*.

## 1.7 prime – *n*-th prime number

**prime**(*n*: *integer*) → *integer*

Return the *n*-th prime number.

## 1.8 nextPrime – generate next prime

**nextPrime**(*n*: *integer*) → *integer*

Return the smallest prime bigger than the given integer *n*.

## 1.9 randPrime – generate random prime

**randPrime**(*n*: *integer*) → *integer*

Return a random *n*-digits prime.

## 1.10 generator – generate primes

**generator((None)) → generator**

Generate primes from 2 to  $\infty$  (as generator).

## 1.11 generator\_eratosthenes – generate primes using Eratosthenes sieve

**generator\_eratosthenes(n: integer) → generator**

Generate primes up to  $n$  using Eratosthenes sieve.

## 1.12 primonial – product of primes

**primonial(p: integer) → integer**

Return the product

$$\prod_{q \in \mathbb{P}_{\leq p}} q = 2 \cdot 3 \cdot 5 \cdots p .$$

## 1.13 properDivisors – proper divisors

**properDivisors(n: integer) → list**

Return proper divisors of  $n$  (all divisors of  $n$  excluding 1 and  $n$ ).

It is only useful for a product of small primes.

The output is the list of all proper divisors.

## 1.14 primitive\_root – primitive root

**primitive\_root(p: integer) → integer**

Return a primitive root of  $p$ .

$p$  must be an odd prime.

### 1.15 Lucas\_chain – Lucas sequence

**Lucas\_chain**( $n$ : *integer*,  $f$ : *function*,  $g$ : *function*,  $x_0$ : *integer*,  $x_1$ : *integer*)  
→ (*integer*, *integer*)

Return the value of  $(x_n, x_{n+1})$  for the sequence  $\{x_i\}$  defined as:

$$\begin{aligned}x_{2i} &= f(x_i) \\ x_{2i+1} &= g(x_i, x_{i+1}),\end{aligned}$$

where the initial values  $x_0, x_1$ .

$f$  is the function which can be input as 1-ary integer.  $g$  is the function which can be input as 2-ary integer.

#### Examples

```
>>> prime.primeq(131)
True
>>> prime.primeq(133)
False
>>> g = prime.generator()
>>> g.next()
2
>>> g.next()
3
>>> prime.prime(10)
29
>>> prime.nextPrime(100)
101
>>> prime.properDivisors(2 * 3 * 5 * 7)
[2, 3, 5, 6, 7, 10, 14, 15, 21, 30, 35, 42, 70, 105]
>>> prime.primitive_root(23)
5
```
