Chapter 1

Functions

1.1 arygcd – binary-like gcd algorithms

1.1.1 bit_num – the number of bits

bit_num(a: *integer*) → *integer*

a のビット数の値を返す。

1.1.2 binarygcd – gcd by the binary algorithm

binarygcd(a: *integer*, b: *integer*) → *integer*

binary gcd algorithm を使って a, b の最大公約数の値を返す。

1.1.3 arygcd_i – gcd over gauss-integer

**arygcd_i(a1: *integer*, a2: *integer*, b1: *integer*, b2: *integer*)
→ (*integer*, *integer*)**

二つの gauss 数体 a_1+a_2i , b_1+b_2i の最大公約数の値を返す。“ i ” は虚数。

If the output of arygcd_i(a1, a2, b1, b2) is (c1, c2), then the gcd of a_1+a_2i and b_1+b_2i equals c_1+c_2i .

†This function uses $(1+i)$ -ary gcd algorithm, which is a generalization of the binary algorithm, proposed by A.Weilert[2].

1.1.4 arygcd_w – gcd over Eisenstein-integer

```
arygcd_w(a1: integer, a2: integer, b1: integer, b2: integer)
    → (integer, integer)
```

Eisenstein 数体 $a_1+a_2\omega$, $b_1+b_2\omega$ の最大公約数の値を返す。“ ω ” は 1 の虚立方根。

If the output of `arygcd_w(a1, a2, b1, b2)` is (c_1, c_2) , then the gcd of $a_1+a_2\omega$ and $b_1+b_2\omega$ equals $c_1+c_2\omega$.

†This functions uses $(1-\omega)$ -ary gcd algorithm, which is an generalization of the binary algorithm, proposed by I.B. Damgård and G.S. Frandsen [1].

Examples

```
>>> arygcd.binarygcd(32, 48)
16
>>> arygcd_i(1, 13, 13, 9)
(-3, 1)
>>> arygcd_w(2, 13, 33, 15)
(4, 5)
```
