1.1.12.10	setIsnoetherian – set Noetherian . . . . .	27
1.1.12.11	isdomain – check domain . . . . .	27
1.1.12.12	setIsdomain – set domain . . . . .	27
1.1.13	getRingInstance(function) . . . . .	29
1.1.14	getRing(function) . . . . .	29
1.1.15	inverse(function) . . . . .	29
1.1.16	exact_division(function) . . . . .	29

# Chapter 1

## Classes

†

### 1.1 ring – for ring object

- **Classes**
  - **Ring**
  - **CommutativeRing**
  - **Field**
  - **QuotientField**
  - **RingElement**
  - **CommutativeRingElement**
  - **FieldElement**
  - **QuotientFieldElement**
  - **Ideal**
  - **ResidueClassRing**
  - **ResidueClass**
  - **CommutativeRingProperties**
- **Functions**
  - **getRingInstance**
  - **getRing**
  - **inverse**
  - **exact\_division**

### 1.1.1 †Ring – abstract ring

Ring is an abstract class which expresses that the derived classes are (in mathematical meaning) rings.

Definition of ring (in mathematical meaning) is as follows: Ring is a structure with addition and multiplication. It is an abelian group with addition, and a monoid with multiplication. The multiplication obeys the distributive law.

This class is abstract and cannot be instantiated.

#### Attributes

**zero** additive unit

**one** multiplicative unit

#### Operations

operator	explanation
A==B	Return whether M and N are equal or not.

## Methods

### 1.1.1.1 createElement – create an element

**createElement(self, seed: (*undefined*)) → *RingElement***

Return an element of the ring with seed.

This is an abstract method.

### 1.1.1.2 getCharacteristic – characteristic as ring

**getCharacteristic(self) → *integer***

Return the characteristic of the ring.

The Characteristic of a ring is the smallest positive integer  $n$  s.t.  $na = 0$  for any element  $a$  of the ring, or 0 if there is no such natural number.  
This is an abstract method.

### 1.1.1.3 issubring – check subring

**issubring(self, other: *RingElement*) → *True/False***

Report whether another ring contains the ring as a subring.

This is an abstract method.

### 1.1.1.4 issuperring – check superring

**issuperring(self, other: *RingElement*) → *True/False***

Report whether the ring is a superring of another ring.

This is an abstract method.

#### 1.1.1.5 `getCommonSuperring` – get common ring

`getCommonSuperring(self, other: RingElement) → RingElement`

Return common super ring of self and another ring.

This method uses **issubring**, **issuperring**.

### 1.1.2 †CommutativeRing – abstract commutative ring

CommutativeRing is an abstract subclass of **Ring** whose multiplication is commutative.

CommutativeRing is subclass of **Ring**.  
There are some properties of commutative rings, algorithms should be chosen accordingly. To express such properties, there is a class **CommutativeRingProperties**.

This class is abstract and cannot be instantiated.

#### Attributes

**properties** an instance of **CommutativeRingProperties**

## Methods

### 1.1.2.1 getQuotientField – create quotient field

**getQuotientField(self) → *QuotientField***

Return the quotient field of the ring.

This is an abstract method.

If quotient field of **self** is not available, it should raise exception.

### 1.1.2.2 isdomain – check domain

**isdomain(self) → *True/False/None***

Return True if the ring is actually a domain, False if not, or None if uncertain.

### 1.1.2.3 isnoetherian – check Noetherian domain

**isnoetherian(self) → *True/False/None***

Return True if the ring is actually a Noetherian domain, False if not, or None if uncertain.

### 1.1.2.4 isufd – check UFD

**isufd(self) → *True/False/None***

Return True if the ring is actually a unique factorization domain (UFD), False if not, or None if uncertain.

### 1.1.2.5 ispid – check PID

**ispid(self) → *True/False/None***

Return True if the ring is actually a principal ideal domain (PID), False if not, or None if uncertain.

#### 1.1.2.6 iseuclidean – check Euclidean domain

**iseuclidean(self) → *True/False/None***

Return True if the ring is actually a Euclidean domain, False if not, or None if uncertain.

#### 1.1.2.7 isfield – check field

**isfield(self) → *True/False/None***

Return True if the ring is actually a field, False if not, or None if uncertain.

#### 1.1.2.8 registerModuleAction – register action as ring

**registerModuleAction(self, action\_ring: *RingElement*, action: *function*)**  
**→ (*None*)**

Register a ring `action_ring`, which act on the ring through `action` so the ring be an `action_ring` module.

See **hasaction**, **getaction**.

#### 1.1.2.9 hasaction – check if the action has

**hasaction(self, action\_ring: *RingElement*) → *True/False***

Return True if `action_ring` is registered to provide action.

See **registerModuleAction**, **getaction**.

#### 1.1.2.10 getaction – get the registered action

**hasaction(self, action\_ring: *RingElement*) → *function***

Return the registered action for `action_ring`.

See **registerModuleAction**, **hasaction**.

### 1.1.3 †Field – abstract field

Field is an abstract class which expresses that the derived classes are (in mathematical meaning) fields, i.e., a commutative ring whose multiplicative monoid is a group.

Field is subclass of **CommutativeRing**. **getQuotientField** and **isfield** are not abstract (trivial methods).

This class is abstract and cannot be instantiated.

## Methods

### 1.1.3.1 gcd – gcd

`gcd(self, a: FieldElement, b: FieldElement) → FieldElement`

Return the greatest common divisor of `a` and `b`.

A field is trivially a UFD and should provide `gcd`. If we can implement an algorithm for computing `gcd` in an Euclidean domain, we should provide the method corresponding to the algorithm.

#### 1.1.4 †QuotientField – abstract quotient field

QuotientField is an abstract class which expresses that the derived classes are (in mathematical meaning) quotient fields.

`self` is the quotient field of `domain`.

QuotientField is subclass of **Field**.

In the initialize step, it registers trivial action named as `baseaction`; i.e. it expresses that an element of a domain acts an element of the quotient field by using the multiplication in the domain.

This class is abstract and cannot be instantiated.

#### Attributes

**basedomain** domain which generates the quotient field `self`

### 1.1.5 †RingElement – abstract element of ring

RingElement is an abstract class for elements of rings.

This class is abstract and cannot be instantiated.

#### Operations

operator	explanation
A==B	equality (abstract)

## Methods

### 1.1.5.1 `getRing` – `getRing`

`getRing(self) → Ring`

Return an object of a subclass of `Ring`, to which the element belongs.

This is an abstract method.

### 1.1.6 †CommutativeRingElement – abstract element of commutative ring

CommutativeRingElement is an abstract class for elements of commutative rings.

This class is abstract and cannot be instantiated.

## Methods

### 1.1.6.1 `mul_module_action` – apply a module action

`mul_module_action(self, other: RingElement) → (undefined)`

Return the result of a module action. `other` must be in one of the action rings of `self`'s ring.

This method uses `getRing`, `CommutativeRing` and `getaction`. We should consider that the method is abstract.

### 1.1.6.2 `exact_division` – division exactly

`exact_division(self, other: CommutativeRingElement)  
→ CommutativeRingElement`

In UFD, if `other` divides `self`, return the quotient as a UFD element.

The main difference with `/` is that `/` may return the quotient as an element of quotient field.

Simple cases:

- in a Euclidean domain, if remainder of euclidean division is zero, the division `//` is exact.
- in a field, there's no difference with `/`.

If `other` doesn't divide `self`, raise `ValueError`. Though `__divmod__` can be used automatically, we should consider that the method is abstract.

### 1.1.7 †FieldElement – abstract element of field

FieldElement is an abstract class for elements of fields.

FieldElement is subclass of **CommutativeRingElement**. **exact\_division** are not abstract (trivial methods).

This class is abstract and cannot be instantiated.

### 1.1.8 †QuotientFieldElement – abstract element of quotient field

QuotientFieldElement class is an abstract class to be used as a super class of concrete quotient field element classes.

QuotientFieldElement is subclass of **FieldElement**.  
`self` expresses  $\frac{\text{numerator}}{\text{denominator}}$  in the quotient field.

This class is abstract and should not be instantiated.  
`denominator` should not be 0.

#### Attributes

**numerator** numerator of `self`

**denominator** denominator of `self`

#### Operations

operator	explanation
A+B	addition
A-B	subtraction
A*B	multiplication
A**B	powering
A/B	division
-A	sign reversion (additive inversion)
inverse(A)	multiplicative inversion
A==B	equality

### 1.1.9 †Ideal – abstract ideal

Ideal class is an abstract class to represent the finitely generated ideals.

†Because the finitely-generatedness is not a restriction for Noetherian rings and in the most cases only Noetherian rings are used, it is general enough.

This class is abstract and should not be instantiated.  
`generators` must be an element of the `aring` or a list of elements of the `aring`.  
If `generators` is an element of the `aring`, we consider `self` is the principal ideal generated by `generators`.

#### Attributes

`ring` the ring belonged to by `self`

`generators` generators of the ideal `self`

#### Operations

operator	explanation
<code>I+J</code>	addition $\{i + j \mid i \in I, j \in J\}$
<code>I*J</code>	multiplication $IJ = \{\sum_{i,j} ij \mid i \in I, j \in J\}$
<code>I==J</code>	equality
<code>e in I</code>	For <code>e</code> in the ring, to which the ideal <code>I</code> belongs.

## Methods

### 1.1.9.1 `issubset` – check subset

`issubset(self, other: Ideal) → True/False`

Report whether another ideal contains this ideal.

We should consider that the method is abstract.

### 1.1.9.2 `issuperset` – check superset

`issuperset(self, other: Ideal) → True/False`

Report whether this ideal contains another ideal.

We should consider that the method is abstract.

### 1.1.9.3 `reduce` – reduction with the ideal

`issuperset(self, other: Ideal) → True/False`

Reduce an element with the ideal to simpler representative.

This method is abstract.

### 1.1.10 †ResidueClassRing – abstract residue class ring

#### Initialize (Constructor)

```
ResidueClassRing(ring: CommutativeRing, ideal: Ideal)  
    → ResidueClassRing
```

A residue class ring  $R/I$ , where  $R$  is a commutative ring and  $I$  is its ideal.

ResidueClassRing is subclass of **CommutativeRing**.  
**one**, **zero** are not abstract (trivial methods).

Because we assume that **ring** is Noetherian, so is **ring**.

This class is abstract and should not be instantiated.  
**ring** should be an instance of **CommutativeRing**, and **ideal** must be an instance of **Ideal**, whose **ring** attribute points the same ring with the given **ring**.

#### Attributes

**ring** the base ring  $R$

**ideal** the ideal  $I$

#### Operations

operator	explanation
<b>A==B</b>	equality
<b>e in A</b>	report whether <b>e</b> is in the residue ring <b>self</b> .

### 1.1.11 †ResidueClass – abstract an element of residue class ring

#### Initialize (Constructor)

**ResidueClass**(*x*: *CommutativeRingElement*, *ideal*: *Ideal*)  
→ **ResidueClass**

Element of residue class ring  $x + I$ , where  $I$  is the modulus ideal and  $x$  is a representative element.

ResidueClass is subclass of **CommutativeRingElement**.

This class is abstract and should not be instantiated.  
*ideal* corresponds to the ideal  $I$ .

#### Operations

These operations uses **reduce**.

operator	explanation
$x+y$	addition
$x-y$	subtraction
$x*y$	multiplication
$A==B$	equality

### 1.1.12 †CommutativeRingProperties – properties for CommutativeRingProperties

#### Initialize (Constructor)

**CommutativeRingProperties((None)) → CommutativeRingProperties**

Boolean properties of ring.

Each property can have one of three values; *True*, *False*, or *None*. Of course *True* is true and *False* is false, and *None* means that the property is not set neither directly nor indirectly.

CommutativeRingProperties class treats

- Euclidean (Euclidean domain),
- PID (Principal Ideal Domain),
- UFD (Unique Factorization Domain),
- Noetherian (Noetherian ring (domain)),
- field (Field)

## Methods

### 1.1.12.1 isfield – check field

**isfield(self) → *True/False/None***

Return True/False according to the field flag value being set, otherwise return None.

### 1.1.12.2 setIsfield – set field

**isfield(self, value: *True/False*) → (*None*)**

Set True/False value to the field flag.  
Propagation:

- True → euclidean

### 1.1.12.3 iseclidean – check euclidean

**iseclidean(self) → *True/False/None***

Return True/False according to the euclidean flag value being set, otherwise return None.

### 1.1.12.4 setIseclidean – set euclidean

**isfield(self, value: *True/False*) → (*None*)**

Set True/False value to the euclidean flag.  
Propagation:

- True → PID
- False → field

#### 1.1.12.5 ispid – check PID

**ispid(self) → *True/False/None***

Return True/False according to the PID flag value being set, otherwise return None.

#### 1.1.12.6 setIspid – set PID

**ispid(self, value: *True/False*) → (*None*)**

Set True/False value to the euclidean flag.  
Propagation:

- True → UFD, Noetherian
- False → euclidean

#### 1.1.12.7 isufd – check UFD

**isufd(self) → *True/False/None***

Return True/False according to the UFD flag value being set, otherwise return None.

#### 1.1.12.8 setIsufd – set UFD

**isufd(self, value: *True/False*) → (*None*)**

Set True/False value to the UFD flag.  
Propagation:

- True → domain

- False  $\rightarrow$  PID

#### 1.1.12.9 isnoetherian – check Noetherian

**isnoetherian(self)  $\rightarrow$  *True/False/None***

Return True/False according to the Noetherian flag value being set, otherwise return None.

#### 1.1.12.10 setIsnoetherian – set Noetherian

**isnoetherian(self, value: *True/False*)  $\rightarrow$  (*None*)**

Set True/False value to the Noetherian flag.  
Propagation:

- True  $\rightarrow$  domain
- False  $\rightarrow$  PID

#### 1.1.12.11 isdomain – check domain

**isdomain(self)  $\rightarrow$  *True/False/None***

Return True/False according to the domain flag value being set, otherwise return None.

#### 1.1.12.12 setIsdomain – set domain

**isdomain(self, value: *True/False*)  $\rightarrow$  (*None*)**

Set True/False value to the domain flag.  
Propagation:

- False  $\rightarrow$  UFD, Noetherian

### 1.1.13 `getRingInstance(function)`

**`getRingInstance(obj: RingElement) → RingElement`**

Return a `RingElement` instance which equals `obj`.

Mainly for python built-in objects such as `int` or `float`.

### 1.1.14 `getRing(function)`

**`getRing(obj: RingElement) → Ring`**

Return a ring to which `obj` belongs.

Mainly for python built-in objects such as `int` or `float`.

### 1.1.15 `inverse(function)`

**`inverse(obj: CommutativeRingElement) → QuotientFieldElement`**

Return the inverse of `obj`. The inverse can be in the quotient field, if the `obj` is an element of non-field domain.

Mainly for python built-in objects such as `int` or `float`.

### 1.1.16 `exact_division(function)`

**`exact_division(self: RingElement, other: RingElement)`  
`→ RingElement`**

Return the division of `self` by `other` if the division is exact.

Mainly for python built-in objects such as `int` or `float`.

## Examples

```
>>> print ring.getRing(3)
Z
```

```
>>> print ring.exact_division(6, 3)
2L
```
