# Chapter 1

## Classes

### 1.1 round2 – the round 2 method

- **Classes**
  - **ModuleWithDenominator**
- **Functions**
  - **round2**
  - **Dedekind**

The round 2 method is for obtaining the maximal order of a number field from an order generated by a root of a defining polynomial of the field.

This implementation of the method is based on [1](Algorithm 6.1.8) and [2](Chapter 3).

### 1.1.1 ModuleWithDenominator – bases of $\mathbb{Z}$ -module with denominator.

#### Initialize (Constructor)

**ModuleWithDenominator**(basis: *list*, denominator: *integer*, **\*\*hints:** *dict*)

→ *ModuleWithDenominator*

This class represents bases of  $\mathbb{Z}$ -module with denominator. It is not a general purpose  $\mathbb{Z}$ -module, you are warned. **basis** is a list of integer sequences.

**denominator** is a common denominator of all bases.

† Optionally you can supply keyword argument **dimension** if you would like to postpone the initialization of **basis**.

#### Operations

operator	explanation
<b>A</b> + <b>B</b>	sum of two modules
<b>a</b> * <b>B</b>	scalar multiplication
<b>B</b> / <b>d</b>	divide by an integer

## Methods

### 1.1.1.1 `get_rationals` – get the bases as a list of rationals

`get_rationals(self) → list`

Return a list of lists of rational numbers, which is bases divided by denominator.

### 1.1.1.2 `get_polynomials` – get the bases as a list of polynomials

`get_polynomials(self) → list`

Return a list of rational polynomials, which is made from bases divided by denominator.

### 1.1.1.3 `determinant` – determinant of the bases

`determinant(self) → list`

Return determinant of the bases (bases ought to be of full rank and in Hermite normal form).

### 1.1.2 round2(function)

**round2(minpoly\_coeff: *list*) → (*list*, *integer*)**

Return integral basis of the ring of integers of a field with its discriminant. The field is given by a list of integers, which is a polynomial of generating element  $\theta$ . The polynomial ought to be monic, in other word, the generating element ought to be an algebraic integer.

The integral basis will be given as a list of rational vectors with respect to  $\theta$ .

### 1.1.3 Dedekind(function)

**Dedekind(minpoly\_coeff: *list*, p: *integer*, e: *integer*)**  
**→ (*bool*, *ModuleWithDenominator*)**

This is the Dedekind criterion.

minpoly\_coeff is an integer list of the minimal polynomial of  $\theta$ .

p\*\*e divides the discriminant of the minimal.

The first element of the returned tuple is whether the computation about p is finished or not. polynomial.
